(647) 205-3402 | rahdin.zaman@mail.utoronto.ca | [linkedin.com/in/rahdin-zaman](https://www.linkedin.com/in/rahdin-zaman) | github.com/Rahdin

TECHNICAL SKILLS

Analytics & BI: Power BI(Proficient), Tableau, Microsoft Excel(Advanced), DAX, Microsoft Power Platform, Data Modeling, Dashboarding
Languages & Databases: SQL(Proficient) (Microsoft SQL Server, PostgreSQL, MySQL), Python, R, Java, JavaScript, Scala
Data & Statistics: Pandas, NumPy, Scikit-learn, XGBoost, PySpark, Statistical Modeling, Time-Series Forecasting, A/B Testing, ETL
Visualization & Tools: Matplotlib, Seaborn, Git, GitHub, Jupyter Notebook, Docker, Microsoft Azure, AWS

EDUCATION

University of Toronto - St. George Campus Sep.2021 – June 2027
Bachelor of Arts and Science, Mathematics and Statistics double major Toronto, ON
Enrolled in Arts and Science Internship Program(ASIP)(Co-Op)

EXPERIENCE

Junior Software Engineer May. 2024 - August. 2025
Fullstack Rush Sydney, Australia (Remote)

- **Built a secure data pipeline** using Python and FastAPI to sanitize, validate, and route structured client data into Microsoft Business Central, achieving **100% automated client onboarding** and enforcing data integrity across the workflow.
- **Optimized REST API payloads and caching** across multiple client domains (e-commerce, creative, financial), yielding **90+ Lighthouse performance scores** and improving organic search visibility.
- **Engineered an e-commerce platform** using React and Node.js to reduce cart abandonment, integrating dynamic routing and automated 3PL logistics APIs to eliminate manual shipping entry and ensure reliable 3-day nationwide delivery.
- **Architected a high-performance multimedia portfolio** for a design agency, implementing asynchronous video buffering and a Firebase backend that improved mobile load speeds by **35%** and accelerated client lead capture.

PROJECTS

Mutual-Fund Lead Scoring & Prioritization (Python, SQL, XGBoost) | GITHUB

- Built an **end-to-end lead-scoring pipeline** on **41,188** banking direct-marketing records, ingesting raw data into SQL and engineering leakage-free features to predict client product take-up.
- Trained and benchmarked **logistic-regression and XGBoost** propensity models (**0.81 ROC-AUC**), excluding post-contact data leakage to keep scores decision-useful for outbound targeting.
- Translated model scores into a **capacity-constrained call list**, showing the **top 20% of leads capture 66% of conversions** at **3.8× the value per contact** versus untargeted outreach.

Real Estate Market Intelligence Dashboard (Power BI, SQL, Python) | GITHUB

- Scoped and built an end-to-end analytics solution on a raw dataset of **3,360 Calgary residential listings** that lacked the structured dimensions needed for investment analysis, replicating an enterprise raw-data-to-dashboard workflow.
- Cleaned and transformed unstructured fields in **Python (pandas)**, deriving city quadrant, postal forward-sortation area, property type, price tier, and price-per-square-foot, and shaped them into a clean **14-column semantic data model**.
- Authored **17 reusable DAX measures** (median/average price, price-per-sq.ft, market-share %, affordability metrics) and designed a **5-page interactive Power BI report** with cross-filtering slicers, KPI cards, and drillable charts spanning geography, property mix, brokerage, and pricing.
- Delivered a **decision-ready dashboard** enabling self-service analysis of pricing, supply, and value trends across **309 neighbourhoods** and **217 brokerages**, owning the full pipeline from data modeling to stakeholder-facing visualization.

Mortality Forecasting for Insurance Risk (Python, R) | GITHUB

- Built life tables from **Human Mortality Database** records (USA 1933–2023, Bulgaria 1947–2021), computing central death rates and standardizing data to model the cross-country life-expectancy gap.
- **Benchmarked three forecasting approaches** – a hybrid Lee–Carter rotation, an LSTM baseline, and a GLM – evaluating on MSE/RMSE and **reducing error by 64.6%** versus the GLM baseline.
- Implemented a classic **Lee–Carter benchmark in R** using **StMoMo**, projecting life expectancy to 2050 to provide a transparent, reproducible actuarial baseline.
